EV
Block in around the rough opening approximately 12” to 18” as illustrated.
Lay down a base layer of felt paper around the opening.
Position the skylight down over the opening and secure to the roof with anchor brackets. The flange should lay over the course of shakes along the lower edge.

Along the side, the first layer of felt, which lies over the last course of shakes, is run under the L gasket. The first shake on the side is also positioned under the L gasket.

Subsequent layers of felt paper and wood shakes lie over the L gasket.

At the top, felt and shakes are placed over the L gasket. Continue to apply shakes up the roof.
